

Deployment

Deployment Preparation

All configurations verified in the developer environment.

Environment Verification

- All configurations including Incident Assignment Rules and SLA definitions were verified.
- Ensured no conflict with Out-of-the-Box (OOTB) ServiceNow modules.
- Confirmed all Update Sets were captured properly.
- Validated that flows were active and functioning correctly.

Security & Access Validation

- Verified Support Agent and Support Manager roles.
- Confirmed ACLs allow appropriate Create, Read, Write permissions.
- Validated group membership mapping for support teams.
- Conducted impersonation testing to ensure restricted access for unauthorized users.

Logic & Automation Testing

- Flow Designer automation set to **Active** state.
- Verified trigger executes on Incident creation.

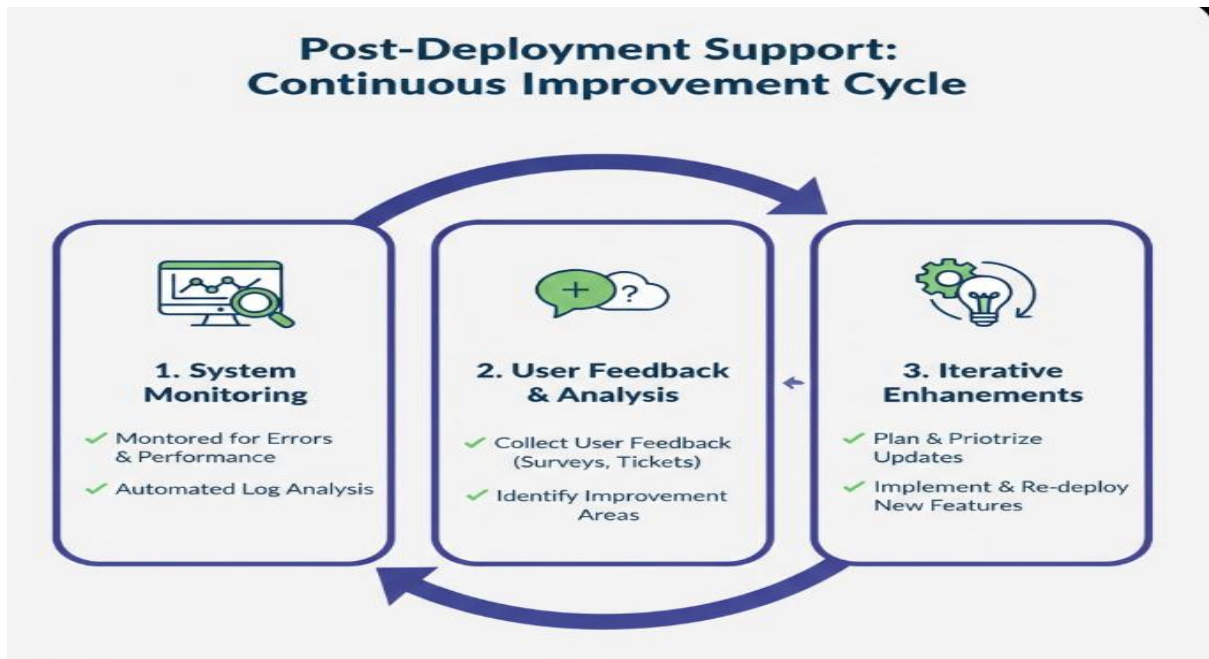

- Confirmed automatic population of “Assignment Group” and “Assigned To” fields.
- Tested SLA timer initiation and escalation process.

Deployment Activities

Application activated in Global scope.

Users provided with access credentials.

Basic training provided to users.

- Application activated in the appropriate scope.
- Users were granted access based on roles.
- Basic training provided on:
 - Creating incidents
 - Updating ticket status
 - Monitoring SLAs
 - Viewing dashboards
- System walkthrough conducted for support team members
