

Development

Configuration Activities

Creation of users Alice and Bob.

User Creation

Support users were created in the system:

- Support Agent 1
- Support Agent 2
- Support Manager

Role Creation

The following roles were configured:

- Support Agent
- Support Manager
- System Administrator

Roles were assigned to users based on responsibilities.

Group Configuration

- Support Groups were created (e.g., Network Support, Software Support).
- Users were assigned to appropriate groups.
- Group-based assignment ensures balanced workload distribution.

Application Development

The system was configured using out-of-the-box features.

Incident Table Usage

The standard Incident table was used to manage support tickets.

Configured Fields:

- Category
- Priority
- Assignment Group
- Assigned To
- State
- SLA
- Work Notes

Assignment Rules Configuration

Assignment rules were created to:

- Automatically assign tickets based on category
- Route high-priority incidents to senior agents
- Implement group-based routing

SLA Configuration

SLA definitions were created based on priority levels:

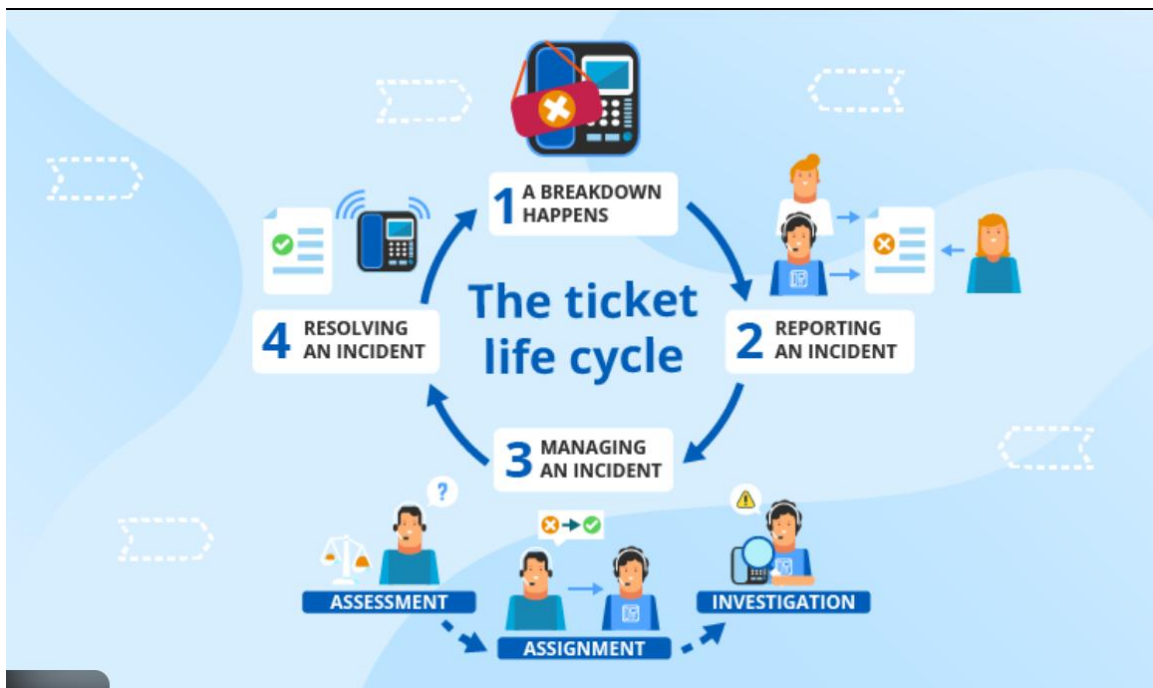

- High Priority → Short response time
- Medium Priority → Moderate response time
- Low Priority → Standard response time

Workflow Development

Automation was implemented using **Flow Designer**.

Flow Configuration:

- Trigger: When a new Incident is created
- Condition: Check category and priority
- Action:
 - Assign to appropriate Support Group
 - Start SLA timer
 - Send notification to assigned agent

Escalation Flow:

- If SLA is breached
- Notify Support Manager
- Reassign if necessary

This automation eliminates manual intervention and improves efficiency.
