

Streamlining Ticket Assignment for Efficient Support Operation

Study & Literature Review

Problem Statement

In a compact project team comprising Alice, the Project Manager, and Bob, a Team Member, the absence of structured ticket-handling processes leads to confusion and inefficiency. The current setup lacks defined roles and access controls, meaning task ownership is unclear and permissions are inconsistently enforced. Without a formal ticket assignment workflow or escalation plan, tasks may stagnate or become misdirected, resulting in delays and diminished accountability. Additionally, the lack of categorization, prioritization, and reporting mechanisms hinders visibility into progress, making it difficult to monitor task status or measure performance effectively.

Introduction

The “**Streamlining Ticket Assignment for Efficient Support Operations**” project was initiated to address inefficiencies in the existing ticket handling and assignment process within the organization. Previously, tickets were manually assigned to support teams, leading to delays, incorrect routing, uneven workload distribution, and reduced customer satisfaction.

This solution leverages **ServiceNow automation and workflows** to automatically route incoming tickets to the appropriate support groups based on predefined rules such as category, priority, and issue type. The system improves operational efficiency, reduces resolution time, ensures accountability, and enhances the overall service experience.

ServiceNow Platform Overview

ServiceNow is a cloud-based enterprise platform used for workflow automation and service management.

It provides low-code development features to build custom applications without extensive programming.

The platform follows a database-driven architecture where all configurations are stored as records.

Concepts Studied

Users, roles, and groups management for access control.

Creation of custom tables and fields.

Application and module configuration.

Flow Designer for process automation.

Impersonation for testing user access.

Outcome of Study

- Faster ticket resolution
- Automated workload distribution
- Reduced manual effort
- Improved support efficiency
- Better customer satisfaction
- Transparent ticket tracking
- Compliance through audit logs
