

Testing

Testing Strategy

Testing was conducted to ensure that the automated ticket assignment system functions correctly within the **ServiceNow** Developer Instance.

Types of Testing Performed:

- Functional Testing
- Security Testing
- Workflow Testing
- SLA Validation Testing
- User Acceptance Testing

Each module was verified individually and then tested as an integrated system.

Test Scenarios

User Login & Access Verification

- Verified login for Support Agent and Support Manager.
- Checked role-based menu visibility

Incident Creation Testing

- Created new incidents from the Service Portal.
- Verified that incident number is generated.

Automatic Assignment Testing

- Confirmed that tickets are automatically assigned based on category.
- Verified round-robin distribution within support groups.

SLA Monitoring Testing

- Checked SLA timer start after ticket creation.
- Simulated SLA breach to verify escalation notification.

Workflow Execution Testing

- Verified Flow Designer triggers correctly.
- Ensured notifications are sent to assigned agents.

Security & Access Control Testing

- Confirmed only authorized users can view and update tickets.
- Tested impersonation to validate access restrictions.

Test Results

The image shows a screenshot of the ServiceNow interface. On the left, the 'Workflow Studio' is visible, showing a trigger 'Operations related Created or Updated' and an action 'Update Operations related Record'. The main part of the image is a 'New Record' form for 'Operations related'. The form has fields for 'Service request No', 'Name', 'Assigned to group', 'Assigned to user', 'Comment', 'Issue', 'Priority', and 'Ticket raised Date'. There is a 'Submit' button at the bottom of the form. The background shows the 'Regarding Platform' section of the ServiceNow interface.

- Incident form is accessible through Service Portal.
- Ticket numbers are generated successfully.
- Assignment rules work correctly.
- Flow automation executes without errors.
- SLA timers start automatically.
- Escalation notifications are triggered properly.
- Role-based access is strictly enforced.
- Dashboard displays accurate ticket statistics
